

Supply Chain Analytics — Example Prompts

Prepared by: Isha, Business Intelligence Analyst

A selection of the prompts used to direct this project's build, from initial model discovery through data quality remediation, star schema design, DAX measures, time intelligence, and row-level security.

1. Initial Model Discovery

I am building a Supply Chain Analytics solution in Power BI. The business problem is: leadership needs visibility into supplier performance, delivery bottlenecks, inventory levels, and order fulfillment efficiency. The end users are Supply Chain Manager and Executive team. I have loaded 12 tables from a supply chain dataset including Purchase Orders, Sales Orders, Shipment Tracking, Supplier Master, Warehouse Inventory, Carriers Master and more. Please connect to my open Power BI Desktop file and give me a full overview of all tables and columns you can see.

2. Data Quality Analysis

First, analyze the data quality issue across all the tables and check data type issues, null values. Duplicate records and then any inconsistency, naming — first to fix all these issues across all the tables.

3. Star Schema Design & Implementation

Remove the missing key rows and then design and implement a proper Star Schema. Identify which tables are fact tables and which are dimension tables. Explain your reasoning for each decision. Then create all relationships with correct cardinality and cross-filter direction. Create a proper Date dimension table spanning 2022 to 2026.

4. DAX Measures Table

Now create a dedicated Measures table. Analyze all 8 fact tables and 5 dimension tables in my supply chain model and create the most relevant and impactful DAX measures for this dataset. Organize them into logical display folders. After creating all measures, give me a complete list of what you built, the DAX formula for each, and a plain English explanation of what each measure tells the business.

5. Time Intelligence

Now create comprehensive time intelligence measures for the key metrics in my model. For Total Purchase Order Value, Total Sales Orders and Order Fulfillment Rate create: MTD, QTD, YTD versions, Month-over-Month Growth %, Year-over-Year Growth %, Same Period Last Year, Rolling 3-Month Average. Add all time intelligence measures to a new display folder called 'Time Intelligence' inside _Measures table.

6. Row-Level Security

Please create 3 RLS roles in my Power BI model: Supply Chain Manager (full access), Supplier View (filtered by supplier), and Warehouse Manager (filtered by warehouse). Use the correct table and column names from my model.

7. Full Project Documentation

Generate complete professional documentation for my Power BI Supply Chain Analytics model as a markdown file including: project overview, business problem and KPIs, data dictionary for all tables and columns, all 50 measure formulas with plain English explanations, Star Schema design decisions, RLS roles documentation, and a Mermaid diagram of the model relationships.

These prompts directed the model design, data cleaning approach, and documentation for this project — see the Executive Summary and Technical Reference for the resulting model.
